

DELIVERABLE

Deliverable 2 — Routing, Logic & Tests

Weight: 25% · Due: end of Week 5 · Phase 2 (AI OFF)

Purpose

Prove your team can build the logic layer of a web application **by hand** — routes that receive requests, validation that defends them, controllers that do the work, and automated tests that prove it works. This deliverable spans Weeks 3-5 and closes the Fundamentals Wall. **No AI was permitted in producing it.**

What to submit

Team Artifact

1. **Routing structure** — a consistent set of routes covering full CRUD, with correct HTTP methods (`/docs/routes.md`).
2. **Input validation** — every create/update route defended with guard-clause validation returning standardized 422 errors (`/docs/validation.md`).
3. **Backend controllers** — thin controllers completing core CRUD on validated data, returning a consistent success envelope. Business logic isolated from routing and validation.
4. **Automated test suite** — tests for core CRUD that **run and pass**, covering happy paths, validation failures, and edge cases.

Individual Artifact (per student)

- **Verifiable Git commits** showing the specific controllers and validation *you* built, with tests you wrote.
- **Successful completion of the live AI-off checkpoint** — building or fixing a route solo, observed.
- Contribution must be visible on the board (owned tickets) and in the commit history.

AI Statement

- This is an AI-off phase. Include a one-line statement in `/docs/ai-notes/deliverable-2.md` confirming no AI assistance was used. (There is no prompt log because there should be nothing to log.)

Submission format

- **Repo:** working routes, validation, controllers, and a runnable test suite; `/docs/routes.md` and `/docs/validation.md` present.
- **Tests:** a documented command that runs the suite (e.g., in the README), and the suite passes.
- **Board:** every member owns controllers/tests; all merges via reviewed PR (branch protection respected).
- **AI statement:** `/docs/ai-notes/deliverable-2.md` .

Grading rubric (50 Team / 50 Individual)

Team (50 pts) | Criteria | Pts | |---|---| | Consistent routing covers full CRUD with correct methods | 10 | | Validation on every create/update route; standardized errors | 12 | | Thin controllers complete core CRUD; logic isolated from routing/validation | 13 | | Automated test suite runs and passes (happy path + failures + edges) | 15 |

Individual (50 pts) | Criteria | Pts | |---|---| | Verifiable commits: student's assigned controllers + validation | 15 | | Student wrote meaningful tests for their work | 12 | | Live AI-off checkpoint completed (build/fix a route solo) | 18 | | Contribution corroborated (board ownership + commits align) | 5 |

Checkpoint weighting is deliberate. The individual half leans on the live checkpoint because it's the clearest proof that the student — not a teammate, not AI — can build this. A student who cannot complete the checkpoint cannot pass the individual half on commits alone.

No-evidence rule: a student with no owned controllers/tests and no committed contribution receives **0** on the individual half, regardless of team score.

Definition of Done

- ☐ Full CRUD routes with correct methods, documented
- ☐ Every create/update route validated; bad input → 422, never a 500
- ☐ Thin controllers wired route → validation → controller; standardized responses

- ❑ Test suite runs green: happy path, validation failures, and edge cases covered
 - ❑ Every member owns work on the board; all merges via reviewed PR
 - ❑ Every member completed the live checkpoint
 - ❑ AI statement present and honest
-

Common ways teams lose points

- **Fat controllers** — validation or persistence stuffed into the controller instead of isolated.
- **Test theater** — tests that assert nothing meaningful, or only cover the happy path.
- **A red suite** — tests that don't actually pass, or don't run at all.
- **Uneven contribution** — one or two members did the controllers; the board shows it.
- **500s on bad input** — validation gaps that crash instead of returning 422.
