

Week 6 — Lab Handout (Student)

Building Your Views

Time: ~90 min in-class **Work as:** Your team (5 members) **AI use this week:** ✓ **ON — required.** Use it to scaffold, then review its output. **Keep a prompt log.** **What you leave with:** Working HTML/CSS views for every screen, including empty/loading/error states.

Why this lab matters

Your logic layer works and is tested. Now you give it a face. Today you turn the wireframes from Deliverable 1 into real, rendered screens — and you start using AI as a professional tool: fast scaffolding, followed by *your* review. Everything you built by hand in Phase 2 is what lets you judge whether AI's markup is actually right.

Task 1 — Break wireframes into components (15 min)

Look at your Week 2 wireframes. List the reusable pieces you'll build once and repeat.

- ☐ Identify shared components (e.g., a list row, a card, a form, a nav bar, a status badge).
- ☐ Map each screen to the components it's composed of.
- ☐ Save the component list to `/docs/components.md`.

The single most reused component is usually the **list row** — build it once.

Task 2 — Build the screens (30 min)

Create the static views for every screen your backlog needs: index/list, detail, create form, edit form.

- ☐ A view exists for each screen, composed from your components.
- ☐ Use **semantic HTML** (headings, lists, forms, buttons) — structure before style.
- ☐ Style lightly to match the wireframe layout. Clean, not fancy.
- ☐ Use placeholder/sample data for now — real data binding comes in Week 7.

Use AI to scaffold a component, then **read every line** and fix what's wrong (accessibility, semantics, matching your wireframe).

Task 3 — Render the states (20 min)

The empty / loading / error states from your Week 2 wireframes are conditionals you write now — not optional polish.

- ☐ **Empty state** — what a list shows with zero records.
- ☐ **Loading state** — a placeholder/spinner while data would load.
- ☐ **Error state** — a message shown when something fails.
- ☐ Each state is reachable and matches your wireframe.

Task 4 — Use AI well, and log it (15 min)

AI is required this week. Use it to move faster — then own the result.

- ☐ Use AI to scaffold at least one component or state, then review and fix its output.
- ☐ Record your key prompts in `/docs/ai-notes/week-06.md`.
- ☐ Mark which components are **AI-generated**, **AI-modified**, or **hand-written**.

Undisclosed AI use is an integrity violation. Disclosure is the norm — using AI is expected.

Task 5 — Commit through the workflow (10 min)

- ☐ Each member owns at least one screen or component on the board.
- ☐ Work merged via **reviewed pull request** (branch protection still applies).
- ☐ Prompt log committed.

End-of-Lab Checklist

- ☐ `/docs/components.md` — component list mapped to screens
 - ☐ A view for every screen, built from components, semantic HTML
 - ☐ Empty, loading, and error states rendered and reachable
 - ☐ `/docs/ai-notes/week-06.md` — prompt log with AI/hand-written labels
 - ☐ Every screen owned on the board; all merges via reviewed PR
-

Looking ahead to Week 7

You'll make these views **interactive** — binding your Create and Update forms to the backend controllers you built in Phase 2, sending data with Fetch/Axios, and handling the loading and error states for real. AI stays on; keep logging.
