

Week 12 — Lab Handout (Student)

Retrospective, Demo & Defense

Time: ~90 min in-class **Work as:** Your team (5 members) — but the **defense is individual and unassisted. AI use this week: ✕** Off for the oral defense. You explain your own code, yourself. **Due at end of session:** Deliverable 4 (QA, Deployment & Final Presentation, 30%)

Why this lab matters

This is the finish line. You'll reflect honestly on the whole build, present your deployed application with a live demo, and each defend your own code unassisted. Twelve weeks ago this was an idea and an empty repo; today it's a working, tested, deployed app — and you can prove you built it.

Task 1 — Final retrospective (15 min)

As a team, run a blameless retro across the whole course.

- ☐ What went well? What didn't? What would you change next time?
- ☐ Capture concrete lessons (not blame) in `/docs/retrospective.md`.

Task 2 — Prepare the presentation (20 min)

Build a short deck + live demo following the arc: **problem → solution → architecture → live demo → what we learned.**

- ☐ Slides cover each stage; architecture explained by following a request.
- ☐ The demo uses the **deployed** app (not localhost).
- ☐ Prepare a backup (screenshots/short video) in case the live demo fails.

Task 3 — Rehearse (15 min)

- ☐ Run the exact demo click-path once, start to finish.
- ☐ Include one graceful failure (submit bad data → the error shows).
- ☐ Each member knows which part they present.

Task 4 — Present & demo (time varies)

- ☐ Deliver the presentation and the live demo of the deployed app.
- ☐ Keep to time; let the demo carry the story.

Task 5 — Defend your code, unassisted (individual)

Each member, alone and without AI:

- ☐ Walk a reviewer through your own code.
- ☐ Answer: why this approach? what happens on invalid input / a missing record? where does validation live?
- ☐ Be honest about what you'd improve.

Deliverable 4 — Final Submission Checklist

(See the Deliverable 4 spec for the full Definition of Done.)

- ☐ A tested, bug-resistant app **deployed to a live URL**, handling edge cases gracefully
- ☐ A professional presentation + live demo
- ☐ `/docs/retrospective.md` and `/docs/deployment.md` present
- ☐ Each member completed the unassisted oral defense
- ☐ Contributions visible on the board and in commit history across the term

You made it

From isolated scripts to a collaboratively built, tested, reviewed, and deployed web application — with the judgment to use AI well. That combination of fundamentals and judgment is what makes an engineer. Well done.
